# SURFACE AREA

Surface Area is the area of all of the sides of a figure. UNITS ARE SQUARED<sup>2</sup>

or  $2lw + 2lh + 2wh = 2 \cdot 10 \cdot 10 + 2 \cdot 10 \cdot 18 + 2 \cdot 10 \cdot 18 = 920 \text{ cm}^2$

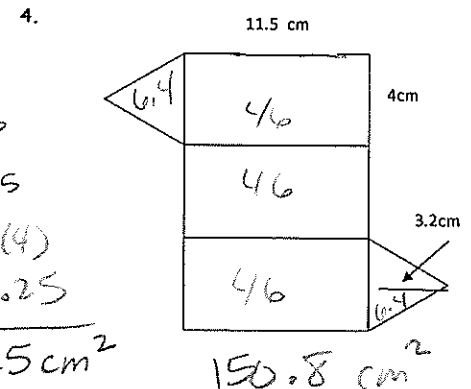

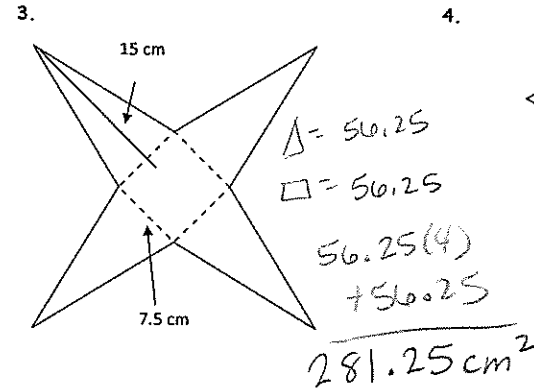

or add up the area of each face

$7 \cdot 7 + 7 \cdot 12 + 7 \cdot 12 + 9.8 \cdot 12 = 334.6 \text{ cm}^2$

5. Henry wants to paint the ceiling and walls of his living room. One gallon of paint covers  $450 \text{ ft}^2$ . The room is  $24 \text{ ft}$  by  $18 \text{ ft}$ , and the walls are  $9 \text{ ft}$  high. How many FULL gallons of paint will Henry need to paint his living room?

Walls:  $2 \cdot 9 \cdot 24 = 432$

# COORDINATE GRAPHING

Coordinate Plane

Complete the following diagram by labeling each box appropriately:

The point where the x-axis and y-axis intersect is called the origin.

How do I identify the exact location of a point?

- 1.) Go across the X axis until you reach the line that the point is located, record the number from the X axis.
- 2.) Then go up/down the Y axis until you reach the line that the point is located, record the number from the Y axis.
- 3.) You have just found your coordinate points.

\*\* Remember, you must find the x value first (x comes before y in the alphabet)

Points CAN lie exactly on the x-axis, y-axis, or even the origin (0,0)

**Reflection:** The flip of a figure over the x-axis or y-axis

When reflecting across X-axis, X values stay same and Y values change signs

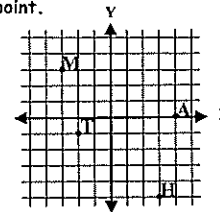

When reflecting across Y-axis, Y values stay same and X values change signs

**Distance:** If two points are in different quadrants, add the absolute values of the unlike coordinates:  $(-3, 1)$  and  $(2, 1) = 3 + 2 = 5$  units

If two points are in the same quadrant, subtract the absolute values of the unlike coordinates:  $(-3, 3)$  and  $(-3, 1) = 3 - 1 = 2$  units
